# CUSTOM FIGURES

*any matplotlib figure, in the handbook's ink and lettering*

7.1 METHOD.

When the built-in diagram, timeline and plot blocks are not enough, draw the figure in matplotlib inside `handbook.STYLE`, write it out with `handbook.svg(fig)`, and include the SVG as an image. The lettering stays live text, so the browser sets it in the same narrow face as the rest of the sheet.

```
with plt.rc_context(handbook.STYLE):
    fig, ax = plt.subplots(figsize=(3.6, 3.2))
    ...                                  # INK and DASHES keep it in the house look
Path("orbit.svg").write_text(handbook.svg(fig))
```

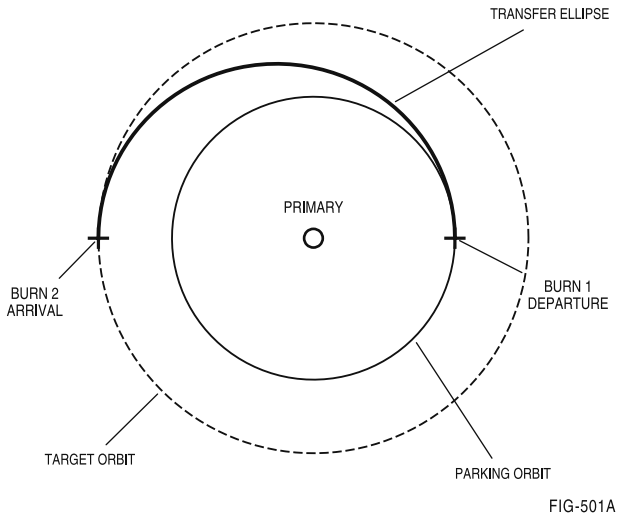

Figure 7-1. Hohmann Transfer between Two Circular Orbits

**NOTE**

Run `python orbit.py` to regenerate the SVG; the sheet only reads it.
